### FIRST-ORDER LOGIC

CHAPTER 8

### Outline

- Why FOL?
- Syntax and semantics of FOL
- Fun with sentences
- Wumpus world in FOL

### Pros and cons of propositional logic

- Propositional logic is declarative: pieces of syntax correspond to facts
- Propositional logic allows partial/disjunctive/negated information (unlike most data structures and databases)
- $\bigcirc$  Propositional logic is **compositional**: meaning of  $B_{1,1} \wedge P_{1,2}$  is derived from meaning of  $B_{1,1}$  and of  $P_{1,2}$
- (unlike natural language, where meaning depends on context)
- Propositional logic has very limited expressive power (unlike natural language)
  - E.g., cannot say "pits cause breezes in adjacent squares" except by writing one sentence for each square

#### First-order logic

Whereas propositional logic assumes world contains facts, first-order logic (like natural language) assumes the world contains

- Objects: people, houses, numbers, theories, Ronald McDonald, colors, baseball games, wars, centuries . . .
- Relations: red, round, bogus, prime, multistoried . . ., brother of, bigger than, inside, part of, has color, occurred after, owns, comes between, ...
- Functions: father of, best friend, third inning of, one more than, end of

# Logics in general

Language	Ontological Commitment	Epistemological Commitment
Propositional logic	facts	true/false/unknown
First-order logic	facts, objects, relations	true/false/unknown
Temporal logic	facts, objects, relations, times	true/false/unknown
Probability theory	facts	degree of belief $\in [0, 1]$
Fuzzy logic	degree of truth $\in [0,1]$	known interval value

### Syntax of FOL: Basic elements

### Atomic sentences

```
Atomic sentence = predicate(term_1, ..., term_n)
                    or term_1 = term_2
```

Term =  $function(term_1, ..., term_n)$ or constant or variable

```
E.g., Brother(KingJohn, RichardTheLionheart)
    > (Length(LeftLegOf(Richard)), Length(LeftLegOf(KingJohn)))
```

A term is a logical expression that refers to an object.

### Complex sentences

Complex sentences are made from atomic sentences using connectives

$$\neg S$$
,  $S_1 \wedge S_2$ ,  $S_1 \vee S_2$ ,  $S_1 \Rightarrow S_2$ ,  $S_1 \Leftrightarrow S_2$ 

E.g. 
$$Sibling(KingJohn, Richard) \Rightarrow Sibling(Richard, KingJohn) > (1,2) \lor \leq (1,2) > (1,2) \land \neg > (1,2)$$

### Truth in first-order logic

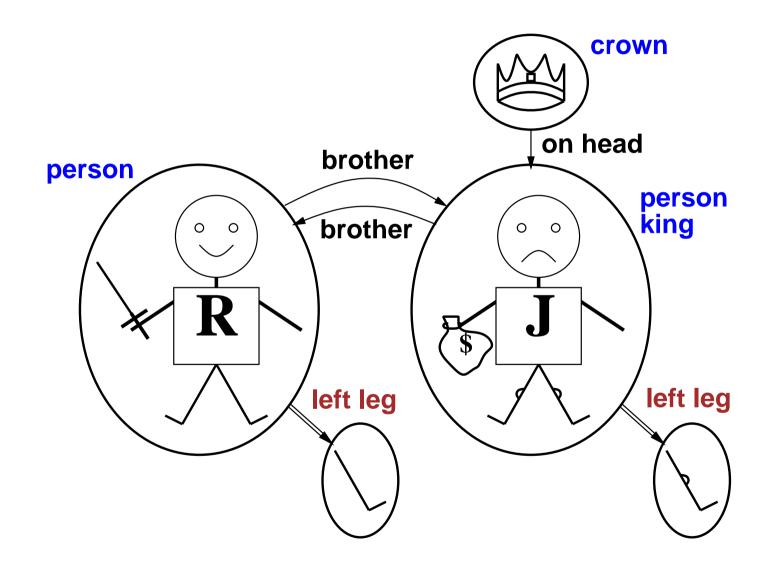

Sentences are true with respect to a model and an interpretation

Model contains  $\geq 1$  objects (domain elements) and relations among them

Interpretation specifies referents for constant symbols → objects predicate symbols → relations function symbols → functional relations

An atomic sentence  $predicate(term_1, \dots, term_n)$  is true iff the objects referred to by  $term_1, \dots, term_n$  are in the relation referred to by predicate

# Models for FOL: Example

#### Truth example

Consider the interpretation in which  $Richard \rightarrow Richard$  the Lionheart  $John \rightarrow the$  evil King John  $Brother \rightarrow the$  brotherhood relation

Under this interpretation, Brother(Richard, John) is true just in case Richard the Lionheart and the evil King John are in the brotherhood relation in the model

#### Models for FOL: Lots!

Entailment in propositional logic can be computed by enumerating models

We can enumerate the FOL models for a given KB vocabulary:

For each number of domain elements n from 1 to  $\infty$ For each k-ary predicate  $P_k$  in the vocabulary

For each possible k-ary relation on n objects

For each constant symbol C in the vocabulary

For each choice of referent for C from n objects . . .

Computing entailment by enumerating FOL models is not easy!

### Universal quantification

 $\forall \langle variables \rangle \langle sentence \rangle$ 

#### Everyone at Berkeley is smart:

 $\forall x \ At(x, Berkeley) \Rightarrow Smart(x)$ 

 $\forall x \ P$  is true in a model m iff P is true with x being each possible object in the model

**Roughly** speaking, equivalent to the conjunction of instantiations of P

```
(At(KingJohn, Berkeley) \Rightarrow Smart(KingJohn))
 \land (At(Richard, Berkeley) \Rightarrow Smart(Richard))
 \land (At(Berkeley, Berkeley) \Rightarrow Smart(Berkeley))
 \land \dots
```

### A common mistake to avoid

Typically,  $\Rightarrow$  is the main connective with  $\forall$ 

Common mistake: using  $\land$  as the main connective with  $\forall$ :

$$\forall x \ At(x, Berkeley) \land Smart(x)$$

means "Everyone is at Berkeley and everyone is smart"

#### Existential quantification

 $\exists \langle variables \rangle \langle sentence \rangle$ 

#### Someone at Stanford is smart:

 $\exists x \ At(x, Stanford) \land Smart(x)$ 

 $\exists x \ P$  is true in a model m iff P is true with x being some possible object in the model

**Roughly** speaking, equivalent to the disjunction of instantiations of P

```
(At(KingJohn, Stanford) \land Smart(KingJohn))
 \lor (At(Richard, Stanford) \land Smart(Richard))
 \lor (At(Stanford, Stanford) \land Smart(Stanford))
 \lor \dots
```

#### Another common mistake to avoid

Typically,  $\wedge$  is the main connective with  $\exists$ 

Common mistake: using  $\Rightarrow$  as the main connective with  $\exists$ :

$$\exists x \ At(x, Stanford) \Rightarrow Smart(x)$$

is true if there is anyone who is not at Stanford!

### Properties of quantifiers

```
\forall x \ \forall y is the same as \forall y \ \forall x (why??)
```

$$\exists x \exists y$$
 is the same as  $\exists y \exists x$  (why??)

$$\exists x \ \forall y \ \text{is } \mathbf{not} \text{ the same as } \forall y \ \exists x$$

$$\exists x \ \forall y \ Loves(x,y)$$

"There is a person who loves everyone in the world"

$$\forall y \; \exists x \; Loves(x,y)$$

"Everyone in the world is loved by at least one person"

Quantifier duality: each can be expressed using the other

$$\forall x \ Likes(x, IceCream) \qquad \neg \exists x \ \neg Likes(x, IceCream)$$

$$\exists x \ Likes(x, Broccoli)$$
  $\neg \forall x \ \neg Likes(x, Broccoli)$ 

Brothers are siblings

#### Brothers are siblings

 $\forall x, y \; Brother(x, y) \Rightarrow Sibling(x, y).$ 

"Sibling" is symmetric

#### Brothers are siblings

 $\forall x, y \; Brother(x, y) \Rightarrow Sibling(x, y).$ 

"Sibling" is symmetric

 $\forall x, y \ Sibling(x, y) \Leftrightarrow Sibling(y, x)$ .

One's mother is one's female parent

#### Brothers are siblings

 $\forall x, y \; Brother(x, y) \Rightarrow Sibling(x, y).$ 

"Sibling" is symmetric

$$\forall x, y \ Sibling(x, y) \Leftrightarrow Sibling(y, x)$$
.

One's mother is one's female parent

$$\forall x, y \; Mother(x, y) \Leftrightarrow (Female(x) \land Parent(x, y)).$$

A first cousin is a child of a parent's sibling

#### Brothers are siblings

 $\forall x, y \; Brother(x, y) \Rightarrow Sibling(x, y).$ 

"Sibling" is symmetric

 $\forall x, y \ Sibling(x, y) \Leftrightarrow Sibling(y, x)$ .

One's mother is one's female parent

$$\forall x, y \; Mother(x, y) \Leftrightarrow (Female(x) \land Parent(x, y)).$$

A first cousin is a child of a parent's sibling

 $\forall x,y \; FirstCousin(x,y) \; \Leftrightarrow \; \exists \, p,ps \; Parent(p,x) \land Sibling(ps,p) \land Parent(ps,y)$ 

#### **Equality**

 $term_1 = term_2$  is true under a given interpretation if and only if  $term_1$  and  $term_2$  refer to the same object

E.g., 
$$1=2$$
 and  $\forall\,x\,\,\times(Sqrt(x),Sqrt(x))=x$  are satisfiable  $2=2$  is valid

E.g., definition of (full) Sibling in terms of Parent:

$$\forall x, y \; Sibling(x, y) \Leftrightarrow \left[ \neg (x = y) \land \exists \, m, f \; \neg (m = f) \land \\ Parent(m, x) \land Parent(f, x) \land Parent(m, y) \land Parent(f, y) \right]$$

### Interacting with FOL KBs

Suppose a wumpus-world agent is using an FOL KB and perceives a smell and a breeze (but no glitter) at t=5:

```
Tell(KB, Percept([Smell, Breeze, None], 5))
Ask(KB, \exists a \ Action(a, 5))
```

I.e., does KB entail any particular actions at t=5?

Answer: Yes,  $\{a/Shoot\}$   $\leftarrow$  substitution (binding list)

Given a sentence S and a substitution  $\sigma$ ,  $S\sigma$  denotes the result of plugging  $\sigma$  into S; e.g., S = Smarter(x,y)  $\sigma = \{x/Hillary, y/Bill\}$   $S\sigma = Smarter(Hillary, Bill)$ 

Ask(KB,S) returns some/all  $\sigma$  such that  $KB \models S\sigma$ 

#### Knowledge base for the wumpus world

#### "Perception"

```
\forall b, g, t \ Percept([Smell, b, g], t) \Rightarrow Smelt(t)
\forall s, b, t \ Percept([s, b, Glitter], t) \Rightarrow AtGold(t)
```

Reflex:  $\forall t \ AtGold(t) \Rightarrow Action(Grab, t)$ 

Reflex with internal state: do we have the gold already?

```
\forall t \ AtGold(t) \land \neg Holding(Gold, t) \Rightarrow Action(Grab, t)
```

Holding(Gold,t) cannot be observed

 $\Rightarrow$  keeping track of change is essential

#### Deducing hidden properties

#### Properties of locations:

$$\forall x, t \ At(Agent, x, t) \land Smelt(t) \Rightarrow Smelly(x)$$
  
 $\forall x, t \ At(Agent, x, t) \land Breeze(t) \Rightarrow Breezy(x)$ 

Squares are breezy near a pit:

Diagnostic rule—infer cause from effect

$$\forall y \ Breezy(y) \Rightarrow \exists x \ Pit(x) \land Adjacent(x,y)$$

Causal rule—infer effect from cause

$$\forall x, y \ Pit(x) \land Adjacent(x, y) \Rightarrow Breezy(y)$$

Neither of these is complete—e.g., the causal rule doesn't say whether squares far away from pits can be breezy

Definition for the Breezy predicate:

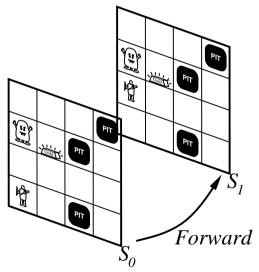

$$\forall y \ Breezy(y) \Leftrightarrow [\exists x \ Pit(x) \land Adjacent(x,y)]$$

#### Keeping track of change

Facts hold in situations, rather than eternally E.g., Holding(Gold, Now) rather than just Holding(Gold)

Situation calculus is one way to represent change in FOL: Adds a situation argument to each non-eternal predicate E.g., Now in Holding(Gold, Now) denotes a situation

Situations are connected by the Result function Result(a,s) is the situation that results from doing a in s

### Summary

#### First-order logic:

- objects and relations are semantic primitives
- syntax: constants, functions, predicates, equality, quantifiers

Increased expressive power: sufficient to define wumpus world

#### Situation calculus:

- conventions for describing actions and change in FOL
- can formulate planning as inference on a situation calculus KB
